As seen in the above Reaction Sequence I, compounds of formula I wherein Y is -NH-, are prepared as follows. The ester II is made to undergo a carbodiimide coupling reaction with protected amino acid III in the presence of ethyl 3-(3-dimethylamino)propyl carbodiimide hydrochloride (WSC) or dicyclohexylcarbodiimide (DCC), and 1-hydroxybenzotriazole monohydrate (HOBT), and N-methylmorpholine (NMM), and in the presence of an inert organic solvent such as dimethylformamide (DMF), THF or N-methylpyrrolidone, to form the amide IV. Amide IV is deprotected by treatment with trifluoroacetic acid with or without the presence of dry inert organic solvent such as dichloromethane, chloroform or THF at temperatures within the range of from about -15° to about 20° C. Sulfonyl chloride V is added followed by organic base such as triethylamine, pyridine or N,N-diisopropylethylamine to form the sulfonamide VI. Sulfonamide VI is hydrolyzed by treatment with alkali metal base such as NaOH or LiOH in the presence of an alcohol solvent such as methanol or ethanol. The reaction mixture is acidified with HCl, KHSO<sub>4</sub> or H<sub>2</sub>SO<sub>4</sub>, to form acid VII. The acid VII is then subjected to a carbodiimide coupling reaction wherein VII is treated with protected amine VIII in the presence of WSC or DCC, and HOBT, and NMM, in the presence of an inert organic solvent such as dimethylformamide, THF or N-methylpyrrolidone, to form sulfonamide IX. The sulfonamide IX is then dissolved in an alcohol solvent such as ethanol or methanol, to which HCl has been added and the mixture is hydrogenated over Pd-C or Pd(OH)<sub>2</sub>-C in the case where P<sup>1</sup> is carbobenzyloxy. The crude material is separated by conventional procedures and the desired isomers are treated with amidine sulfonic acid X in the presence of an alcohol solvent such as ethanol to form the compound of the invention IB.

#### Example I

[(S)-2 $\alpha$ ,4 $\beta$ ]-N-[4-[(Aminoiminomethyl)amino]butyl]-1-[3-hydroxy-2-[(2-naphthalenylsulfonyl)amino]-1-oxopropyl]-4-methyl-2-piperidinecarboxamide, trifluoroacetate (1:1) salt

A. (2R-trans)-1-[(Phenylmethoxy)carbonyl]-4-methyl-2-piperidinecarboxylic acid, ethyl ester

A(1). 4-Methyl-2-piperidinecarbonitrile

To 500 g of sodium hypochlorite solution (5% in Cl<sub>2</sub>, Aldrich) cooled in an ice bath was added dropwise 33.6 g (340 mmol, Aldrich) of 4-methyl-piperidine, over 40 minutes. The reaction mixture was stirred for 20 minutes then poured into a separatory funnel and extracted with two 400 mL portions of ether. The extracts were combined, dried (sodium sulfate) and concentrated in vacuo to give ~44 g of N-chloro intermediate as a yellow liquid.

To a solution of 19.1 g (340 mmol) of potassium hydroxide in 140 mL of 95% ethanol heated to 80 °C was added dropwise over 40 minutes the solution of crude N-chloropiperidine from above in 20 mL of 95% ethanol. The addition was mildly exothermic and a precipitate formed. The reaction mixture was stirred for 10 minutes, cooled to room temperature, concentrated in vacuo, and to the residue was added 85 mL of 2N aqueous NaOH solution. The resulting mixture was extracted with three 75 mL portions of ether. The ether extracts were combined, dried (sodium sulfate) and concentrated in vacuo to give the crude imine as a viscous yellow oil.

To a solution of 110 g (1.7 mol, Mallinckrodt) of potassium cyanide in 400 mL of water cooled in an ice-bath was added over 1 h 183 mL (2.20 mol) of concentrated HCl, followed by the crude imine from above. The reaction mixture was stirred between 10-20 °C for 4 h then cooled in an ice-bath and basified to pH 12 by addition of ~80 g of potassium hydroxide pellets. The resulting solution was poured into a separatory funnel and extracted with three 300 mL portions of ether. The ether layers were combined, dried (sodium sulfate) and concentrated in vacuo to give a yellow oil. The crude material was purified by simple distillation.

at reduced pressure to afford 13.2 g (106 mmol, 31%) of title nitrile as a clear liquid, bp 72-74° (3mm).

A(2). 4-Methyl-2-piperidinecarboxylic acid, ethyl ester

To 250 mL of 6N aqueous HCl solution was added 13.0 g (105 mmol) of Part A(1) nitrile at room temperature. The reaction mixture was heated to reflux (bath temp 145°) for 6 h then cooled to room temperature and concentrated in vacuo to give the crude acid hydrochloride as a solid.

To 250 mL of absolute ethanol cooled in an ice-bath was added dropwise 40 mL (550 mmol) of thionyl chloride over 30 minutes. The solution was stirred for an additional 15 minutes then added to the crude acid hydrochloride from above. The resulting slurry was heated to reflux for 4 h then cooled to room temperature and filtered to remove solids. The filtrate was concentrated in vacuo to give the crude ester amine hydrochloride as brown oil. The oil was partitioned between 150 mL of saturated aqueous potassium carbonate solution and 150 mL of chloroform. The aqueous layer was separated and extracted with two-100 mL portions of chloroform. The organic extracts were combined, dried (sodium sulfate) and concentrated to give crude title ester as a brown oil. Part C BOC-Ser-pipercolic ester (2.80 g, 6.25 mmol) was dissolved in trifluoroacetic acid (TFA) at 0°C, and allowed to warm to RT over 60 min. The TFA was evaporated in vacuo for two hours to provide the TFA salt as an oil (4.2 g). The crude TFA salt was dissolved in dichloromethane (15 mL) and 2-naphthylsulfonyl chloride (Aldrich, 1.58 g, 7.0 mmol) was added, followed by triethylamine (3.5 mL, 25 mmol). The crude product was redissolved in 60 mL of EtOAc, washed with saturated aqueous KHCO<sub>3</sub> solution (3 x 40 mL), brine, dried (Na<sub>2</sub>SO<sub>4</sub>), concentrated, co-evaporated several times with ether and hexane and triturated with 50 mL of hexane to yield of title compound (0.78 g, 88%) as a white solid.

C. N-[4-[(1,1-Dimethylethoxy)carbonyl]amino]butyl]-1-D-phenylalanyl-L-prolinamide

A solution of Part B compound (0.58 g, 1.0 mmol) with 0.12 g of Pd(OH)<sub>2</sub>/carbon in 5.0 mL of methanol was hydrogenated at 1 atm for 3.75 hours. The catalyst was removed by filtration through a porous membrane (Whatman 0.2µ Nylon Autovial), and the filtrate was concentrated to yield title compound (0.39 g, 88%) as a white, hygroscopic solid.

D. N-[4-[(1,1-Dimethylethoxy)carbonyl]amino]butyl]-1-[N-(2-naphthalenylsulfonyl)-D-phenylalanyl]-L-prolinamide

Triethylamine (0.25 mL, 1.8 mmol) was added dropwise to a stirred 0 °C solution of Part C compound (0.39 g, 0.90 mmol) and 2-naphthalenesulfonyl chloride (0.21 g, 0.95 mmol) in 7.0 mL of CH<sub>2</sub>Cl<sub>2</sub>. The reaction was carried out at room temperature for 45 minutes. Dichloromethane was removed under vacuum, the residue was partitioned between EtOAc (50 mL) and aqueous 0.25M KHSO<sub>4</sub> solution (15 mL), the EtOAc layer was washed with 0.25M KHSO<sub>4</sub> solution (3 x 15 mL), brine, dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to yield 0.61 g of a colorless glass. Trituration with 50 mL of hexane yielded title compound (0.52 g, 93%) as a white solid.

E. N-(4-Aminobutyl)-1-[N-(2-naphthalenylsulfonyl)-D-phenylalanyl]-L-prolinamide, trifluoroacetate salt

Trifluoroacetic acid (5.0 mL) was added to ice-cooled Part D compound (0.48 g, 0.77 mmol). The reaction solution was stirred at room temperature for 45 minutes. Trifluoroacetic acid was removed under vacuum and co-evaporated several times with ether and hexane until title compound was obtained as a white solid (0.51 g, ca. 100%).

F. N-[4-[(Aminoiminomethyl)amino]butyl]-1-[N-(2-naphthalenylsulfonyl)-D-phenylalanyl]-L-prolinamide, trifluoroacetate salt, hemihydrate

A solution of Part E compound (0.49 g, 0.77 mmol) in 6.0 mL of absolute ethanol was treated with amidine sulfonic acid (0.14 g, 1.2 mmol) followed by triethylamine (3.2 mL, 2.3 mmol). Within several minutes reaction time, a precipitate appeared. After 5 hours reaction time, TLC analysis of the reaction mixture (silica, 3:1:1 nBuOH:HOAc:H<sub>2</sub>O) indicated a small amount of unconsumed Part E compound. An

additional portion of amidin sulfonic acid (0.05 g) and triethylamine (0.53 mL) were introduced, and the reaction was continued for 16 hours. TLC analysis as above indicated complete consumption of Part E compound. The reaction mixture was concentrated, dissolved in 25 mL of CH<sub>3</sub>OH, and filtered through a porous membrane (Gelman Acrodisc CR PFTE, 0.45  $\mu$ ). Preparative HPLC of the filtered solution (25%B to 100%B, 30 minute gradient) and subsequent lyophilization of the pooled fractions yielded title compound, (258 mg, 48%) as a colorless solid. mp 100-120 °C with foaming.

$[\alpha]_D = +19.4^\circ$  (c = 0.5, CH<sub>3</sub>OH).

TLC: R<sub>f</sub> = 0.70 (silica, 3:1:1 nBuOH ; HOAc; H<sub>2</sub>O).

A. N-[4-[[[1,1-Dimethylethoxy)carbonyl]amino]butyl]-I-[N-(phenylmethoxy)carbonyl]-D-glutaminy]-L-prolinamide

To a stirred solution of Example 7 Part A amine hydrochloride (0.56 g, 1.74 mmol), 1-hydroxybenzotriazole monohydrate (0.29 g, 1.74 mmol) and N-CBZ-D-glutamine (0.49 g, 1.74 mmol) in 15 mL of DMF was added 4-methylmorpholine (0.57 mL, 5.23 mmol) followed by ethyl-3-(3-dimethylamino)propyl carbodiimide hydrochloride (0.33 g, 1.74 mmol). The solution was stirred at room temperature for 19 h and concentrated under pump vacuum at 45 °C. The oily residue was diluted with 160 mL of EtOAc and washed with 1N HCl solution (2x60 mL), saturated NaHCO<sub>3</sub> solution (2x60 mL) and brine (1x60 mL). The EtOAc layer was dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo to give 0.75 g (77%) of title CBZ amine.

TLC: silica gel, 6%CH<sub>3</sub>OH/CH<sub>2</sub>Cl<sub>2</sub>, R<sub>f</sub> 0.22, Ce(SO<sub>4</sub>)<sub>2</sub>.

B. N-[4-[[[1,1-Dimethylethoxy)carbonyl]amino]butyl]-I-[N-(2-naphthalenylsulfonyl)-D-glutaminy]-L-prolinamide

To a stirred solution of Part A CBZ amine (0.73 g, 1.33 mmol) in 12 mL of methanol under argon was added Pd(OH)<sub>2</sub>/C (146 mg, 20% based on the weight of Part A compound). The atmosphere was replaced by hydrogen with several vacuum-fill cycles. The reaction solution was stirred at room temperature for 22 h and the catalyst was filtered off through a 4 $\mu$ M polycarbonate film. The solid was rinsed with methanol (2x20 mL). The filtrate was concentrated in vacuo to give 0.54 g of the intermediate amine. The solid was dissolved in 60 mL of methanol and concentrated in vacuo to give the intermediate amine hydrochloride. To a stirred mixture of this amine hydrochloride and Et<sub>3</sub>N (0.39 mL, 2.31 mmol) in 5 mL of absolute EtOH under argon was added aminoiminomethanesulfonic acid (204 mg, 1.64 mmol). The mixture was stirred at room temperature for 5 h and concentrated in vacuo. The reaction mixture was purified by preparative HPLC, eluting isocratically with a 37% composition of water:methanol (90:10 and 10:90) containing 0.2% H<sub>3</sub>PO<sub>4</sub>. The fractions were concentrated in vacuo and lyophilized to give 260 mg (93%) of title compound.
